

CIST2362 Project Grading Rubric

Project Assessment Categories (total = 100%)

- Correctness (program behavior & tests): 35%
- Structure & Design (functions, OOP, modularity): 25%
- Internal Documentation & Naming (inline comments, names): 15%
- Code Deep-Dive (design rationale, complexity, tradeoffs, hotspots): 15%
- Video Presentation (execution demo + explanation quality): 10%

Rubric (performance levels: Excellent = 4, Good = 3, Satisfactory = 2, Poor = 1)

1) Correctness — 35%

- Excellent (4): All requirements met; passes tests including edge cases; robust error handling.
- Good (3): Most requirements met; passes main tests; minor edge-case issues.
- Satisfactory (2): Core functionality works; several missing features or failing edge cases.
- Poor (1): Major functionality missing/incorrect; frequent crashes or wrong outputs.

2) Structure & Design — 25%

- Excellent (4): Clear modular decomposition, single-responsibility functions/classes, appropriate OOP, low duplication, testable units.
- Good (3): Reasonable modularity and OOP with small inefficiencies or duplication.
- Satisfactory (2): Large/multi-purpose functions/classes, inconsistent OOP, noticeable duplication.
- Poor (1): Monolithic code, misuse/absence of OOP, high duplication, hard to extend/test.

3) Internal Documentation & Naming — 15%

- Excellent (4): Concise rationale comments for nontrivial logic, descriptive and consistent naming, no stale comments.
- Good (3): Adequate comments; mostly clear names; minor stale comments or gaps.
- Satisfactory (2): Sparse/incomplete documentation; some vague names; several stale/redundant comments.
- Poor (1): Little/absent documentation, poor/misleading names.

4) Code Deep-Dive — 15%

Assesses the submitted video deep-dive covering architecture choices, algorithms, complexity, testing strategy, known limitations, and planned improvements.

- Excellent (4): Thorough, well-organized analysis of architecture, algorithmic complexity, tradeoffs, alternatives considered, testing approach, and clear roadmap for improvements; demonstrates deep understanding.
- Good (3): Solid analysis covering most items; some minor gaps in alternatives or complexity reasoning.
- Satisfactory (2): Superficial analysis: mentions design and tests but lacks depth on tradeoffs, complexity, or limitations.
- Poor (1): Little/no meaningful analysis; missing explanations of core design decisions, complexity, or tests.

5) Video Presentation — 10%

Assesses clarity, completeness of execution demo, explanation of key components, and professionalism (audio/video quality, length, pacing).

- Excellent (4): Clear, concise demo showing full execution; explains main components, key algorithms, and rationale; addresses testing and limitations; professional quality.
- Good (3): Demo works and explains most key parts; minor omissions in rationale or limitations; acceptable production quality.
- Satisfactory (2): Partial demo or superficial explanation; misses important components or rationale; production issues hamper understanding.
- Poor (1): Video fails to demonstrate execution or explain the code; poor audio/video or missing.
